KFF/The Washington Post Trans Survey

The Washington Post/KFF Survey Project

Prepared by:

Ashley Kirzinger, Audrey Kearney, Alex Montero, Grace Sparks, Lindsey Dawson, and Mollyann Brodie

KFF
KFF/Washington Post Trans Survey

The latest partnership from KFF and The Washington Post project provides unique insights into the attitudes and experiences of trans adults living in the U.S. There are nearly 2 million people living in the U.S. who identify as transgender or trans, representing less than 1% of all adults. This group reports experiencing stigma and systemic inequality in many aspects of their lives including education, housing, and health care access. In addition, trans people are more likely to be victims of discrimination and violence including verbal and physical assaults and intimidation.

This project is the largest, representative survey of transgender adults living in the U.S., interviewing 515 trans and gender non-conforming individuals, from diverse backgrounds and with differing experiences. KFF and The Washington Post also included a comparison survey of 823 cisgender adults. For more information about sampling and method of recruitment, see methodology.

This survey is the 36th in a series of surveys dating back to 1995 that have been conducted as part of the KFF/The Washington Post Survey Project and the first focusing on transgender, nonbinary, and gender non-conforming people.

Executive Summary

This survey of trans adults, including transgender adults, gender non-conforming people, and nonbinary adults, as well as the comparison survey of cisgender adults is aimed at better understanding the trans experience in the U.S. Six in ten trans adults do not identify as either a “trans man” or a “trans woman,” but rather say “trans, gender non-conforming” or “trans, nonbinary” are better ways of describing themselves. Consistent with these findings, about half of trans adults (48%) use they/them pronouns, and about one-third say they use a combination of they/them, she/her or he/him pronouns. Seven in ten trans adults identify as lesbian, gay, or bisexual. The trans adult population is also younger than the larger cisgender adult population, with the majority of trans adults are younger than 35 years old. One in seven trans adults say they are a Republican or a Republican-leaning independent, with most trans adults identifying as Democrats or Democratic-leaning independents. In addition, six in ten identify as political liberals, while three in ten say they are political moderates, and one in seven are conservatives. The survey identifies four major themes in better understanding the trans experience in the U.S. (developing identity, coming out and transitioning, facing discrimination and barriers, and experiences shape attitudes). Below is a brief overview of key findings by theme, followed by deep dives into each arena.

**Developing identity:** Many transgender adults report understanding their gender identity at a young age and face many difficulties during childhood.

Most trans adults say they knew their gender differed from their sex assigned at birth when they were a child or teenager, but few told others before the age of 18. Trans adults are more likely than cisgender adults to say they felt isolated as a child or teenager and many report serious difficulties growing up,
including unsafe learning environments and mental health struggles. Trans people who report having a trusted adult to confide in while growing up were less likely to report adverse childhood experiences.

- While most trans adults began to understand their own gender identity before they were an adult, only about four in ten of those who recognized their identity this early say they shared this information with others.
- Trans adults are much less likely than cisgender adults to report they felt safe in their homes or at school as a child or teenager, and a minority of trans adults said they felt safe participating in youth sports (44%), youth activities (41%), or in religious gatherings (35%).
- Three in ten trans adults say they experienced homelessness or got kicked out of their home while they were growing up, including nearly four in ten (38%) trans people of color. One in four trans adults say they attended religious services as a child or teenager that tried to change their sexual orientation or gender identity, and one in ten (11%) say they attended conversion or reparative therapy.
- Trans people who report having a trusted adult to talk to about personal issues while growing up were less likely to report feeling unsafe growing up. Yet, a minority of trans adults say they had a trusted adult to talk to about personal issues including, about one-third (34%) of trans people of color.

**Coming out and transitioning:** Transgender adults report a diverse set of experiences in being open with others about their gender identity, as well as the ways they present their gender to others.

Nearly 8 in 10 trans adults (78%) say living as a gender that is different from their gender assigned at birth has made them “more satisfied” with their life. Yet, some trans people are not out to family or friends and a small but significant share (16%) say they “never” physically present as a gender different from their sex assigned at birth. Being “out” is less common among older trans adults (ages 35 and older) as well as trans people of color.

- While most trans adults have told at least some members of their immediate family (68%) or people in their friend group (78%) that they are trans, one in seven (14%) have not come out to any of their family members or friends. This increases to one in five (21%) among trans adults who are 35 or older.
- Trans adults who present as a gender different from the one they were assigned at birth either “all” or “most of the time” are three times more likely to say they are “a lot more satisfied” living as a gender different than their sex assigned at birth compared to those who present as a different gender “some of the time” (62% v. 19%). White trans adults are more likely than trans people of color to present as a different gender than their gender assigned at birth at least most of the time (55% compared to 42%) as are younger trans adults compared to those 35 and older (56% compared to 43%).
• What it means to “transition” differs widely among trans adults, and not all trans adults feel the need to transition in any one way. The majority (88%) of trans adults say they have taken at least one action in transitioning, with most reporting they have made changes to their physical appearance to better fit their gender identity or go by pronouns associated with their gender that are different from their sex assigned at birth.

• Much smaller shares of trans adults report having attended counseling or therapy as a part of their gender transition (38%), using hormone treatments (31%), legally changing their names (24%), or undergoing gender-affirming surgery to change their physical appearance (16%). Notably these experiences are more common among trans men and trans women than those who identify as trans, gender non-conforming or trans, non-binary.

Facing discrimination and barriers: Trans adults report high levels of discrimination, including facing prejudice from health care providers, as well as barriers accessing mental health care.

More than six in ten trans adults have been discriminated against because of their gender identity and/or expression, with verbal attacks being the most commonly experienced form of discrimination reported. Trans adults also face discrimination in accessing health care with nearly half of trans adults saying the health care providers they have come into contact with know “not too much” or “nothing at all” about providing health care to trans people, and many reporting facing bias when getting care. Trans adults are more likely than cisgender adults to report recent mental health struggles as well as more likely to report difficulty accessing mental health coverage.

• A majority of trans adults (64%) have been verbally attacked because of their gender identity, gender expression or sexual identity and one in four report having been physically attacked. The share of trans adults who have been physically attacked because of their gender identity increases to 31% among trans people of color.

• Trans adults face other types of discrimination beyond verbal and physical attacks, including being asked unnecessary or invasive questions at their place of work (49%) or being harassed or feeling unsafe in a restroom or locker room (41%). One in five trans adults report having been fired, denied a job or promotion (21%) or been refused health care from a health care provider (17%) due to their gender identity. One in eight trans adults (13%) say they have been evicted or denied housing because of their gender identity or expression, increasing to one in five (21%) among trans people of color.

• Nearly half of trans adults (47%) say there was a time in the past year where they needed but didn’t get mental health services or medication (compared to a quarter of cisgender adults). Among those who did not get mental health services or medication, cost is the biggest deterrent from getting care.

• Trans adults are more likely than cisgender adults to struggle with adverse mental health experiences including having suicidal thoughts in the past month (43% compared to 16%). In addition, 17% of trans adults say they harmed themselves over that period, compared to 3% of
cisgender adults. The shares of trans adults who report having suicidal thoughts increases to half of those without supportive family members, and one in four of whom say they have engaged in self-harm in the past 12 months.

Experiences shape attitudes: views towards transgender policies are largely driven by familiarity with trans people.

While much of the public at large supports laws prohibiting discrimination against trans people, majorities of adults oppose discussing gender identity in elementary schools or providing gender-affirming care for trans children and teens. Views surrounding trans identities are sharply divided by partisanship, gender identity, and whether cisgender adults know someone who is trans.

- A majority of the U.S. public supports laws that protect trans adults against discrimination in several areas, from housing to health care. Support for these policies also holds across party lines. Republican, however, are significantly more likely than Democrats to oppose laws that prohibit discrimination against trans people, though a majority of Republicans support laws prohibiting discrimination against trans people in all cases except in the U.S. military.

- Large shares of adults say they think it is "inappropriate" to discuss trans identity in public schools with students before grade 6; support increases slightly in grades 6 and up. Trans adults are much more supportive of discussing trans identity in schools compared to cisgender adults.

- Majorities of transgender adults and cisgender adults support trans children and trans teenagers having access to gender-affirming counseling. At least two-thirds of trans adults also support trans children between the ages of 10 and 14 having access to puberty-blocking medications (69%) and three-fourths support trans teenagers (between the ages of 15 and 17) having access to hormonal treatments. By contrast, less than half of cisgender adults support trans children or teenagers having access to either of these gender-affirming treatments (31% and 41%, respectively).

Understanding Identity and Coming Out to Others

Most trans adults (66%) say they began to understand that their gender was different from the sex they were assigned at birth before the age of 18, including a third (32%) who say they began to understand when they were ten years old or younger and another third (34%) who say it began between the ages of 11 and 17. A small share say this awareness happened between the ages of 18 and 25 (18%), 26 and 40 (10%), and 4% say it happened at age 41 or older.

There is a generational divide, with three-fourths of trans adults (73%) between the ages of 18 and 34 saying they were under the age of 18 when they began to understand their gender identity differed from their sex assigned at birth compared to 58% of trans adults who are 35 years old or older.
While most trans adults understood their own gender identity before they reached 18, only about four in ten of those who understood this also told others that they were trans or gender non-conforming before they turned 18. Overall, about one in ten trans adults say they began telling others before the age of 11, and an additional one in five (21%) say they came out to others when they were between 11 and 17 years old. One third of all trans adults say they began telling others when they were between the ages of 18 and 25, and a quarter say they began telling others when they were 26 years old or older. One in ten (12%) trans adults say they have not told anyone they are trans or gender non-conforming. The share of trans adults who haven’t told anyone about their trans identity increases to 18% among those who are 35 or older.
While most trans adults have told all, most, or some of either members of their immediate family (68%) or people in their friend group (78%) that they are trans, one in seven (14%) have not come out to any of their family members or friends. This increases to one in five (21%) who are 35 and older, who are less likely to be out to their immediate family members or to people in their friend group.

Among trans people who have told at least one immediate family member, most (69%) say their family members are at least “somewhat supportive” of their trans identity, including one-fourth who say their family members are “very supportive.” On the flip side, three in ten (31%) say their families are unsupportive, including one in ten (13%) who say their family members are “very unsupportive.” Majorities of white trans adults (68%) and trans adults of color (72%) who have told their immediate family members say their families are at least somewhat supportive, as well as majorities of trans adults who identify as non-binary or gender non-conforming (68%).
Most trans adults (83%) say they physically present as a gender different from the one assigned to them at birth at least some of the time, including three in ten who say they physically present this way “all of the time.” About one in seven trans adults (16%) say they “never” physically present as a gender different from their sex assigned at birth. This is largely driven by trans adults who identify as non-binary or gender non-conforming, with about one in five of this group “never” physically presenting as a gender different from their sex assigned at birth compared to 9% of trans men or women. White trans adults are more likely than trans people of color to present as a different gender than their gender assigned at birth “all” or “most” of the time (56% compared to 42%) as are younger trans adults as compared to trans adults ages 35 and older (56% compared to 43%).
Nearly 8 in 10 trans adults (78%) say that living as a gender different from the one assigned to them at birth has made them “more satisfied” with their life, including just under half (45%) who say they are “a lot more satisfied.” Trans adults who say they present as a different gender “all” or “most of the time” are three times more likely to say they are “a lot more satisfied” living as a gender different from the sex they were assigned at birth, compared to those who present as a different gender “some of the time” (62% v. 19%).
Growing Up Trans

With most trans adults reporting that they began to understand that their gender identity differed from their sex assigned at birth when they were a child or teenager, the KFF/Washington Post survey asked trans adults to report on what it was like growing up. Overall, trans adults report more difficulties in childhood, less safe growing and learning environments, and more mental health struggles than their cisgender counterparts. Some of these differences are mitigated among trans adults who report having a trusted adult while they were growing up. Yet only four in ten trans adults say they had a trusted adult to talk to about personal issues, including about one-third (34%) of trans people of color and less than half (45%) of white trans adults.

About half (53%) of trans adults report having at least a “somewhat happy” childhood but cisgender adults are more than twice as likely as trans adults to say their childhood was “very happy” (36% compared to 15%). Half (46%) of trans adults describe their childhood as unhappy, including 17% who would describe it as “very unhappy.” While trans adults are less likely than cisgender adults to say they would describe their childhood as happy, two-thirds of trans adults (67%) who reported having a trusted adult to talk to say they had a happy childhood, compared to less than half (44%) of trans adults who didn’t have a trusted adult growing up.

While many trans adults report growing up in safe environments, a smaller share of trans adults compared to cisgender adults report they felt generally safe in their homes (69% v. 86%) or at school (55% v. 90%). In addition, they are also much less likely to report they felt safe participating in youth sports (44% v. 70%), youth activities (41% v. 64%), or in religious gatherings (35% v. 76%).

KFF and The Washington Post: Trans Survey
Once again, having a trusted adult did seem to matter for trans kids and teenagers. Trans adults who say they had a trusted adult growing up are more likely to report they felt safe as a child or teenager both at home (85%) and at school (65%), compared to trans people without a trusted adult growing up (60% and 48%, respectively).

**ISOLATION AND MENTAL HEALTH STRUGGLES GROWING UP**

Large shares of trans adults report adverse mental health experiences during their childhood. Eight in ten trans adults (78%) say growing up they experienced serious mental health problems such as depression or anxiety, and three in ten (29%) say they had alcohol or drug use problems as a child or teenager. Three in ten trans adults say they experienced homelessness or got kicked out of their home while they were growing up, including nearly four in ten (38%) trans people of color. One in four trans adults say they attended religious services as a child or teenager that tried to change their sexual orientation or gender identity, and one in ten (11%) say they attended conversion or reparative therapy. Trans adults facing adverse mental health challenges as children or teenagers was equally common, regardless of whether they had a trusted adult to talk to about personal issues.
The Diversity of Trans Experiences and Identity

Six in ten adults whose gender identity differs from their sex assigned at birth do not identify as either a “trans man” or a “trans woman,” but rather say “trans, gender non-conforming” (22%) or “trans, nonbinary” (40%) are the best ways of describing themselves. Nearly half of trans adults 18-34 say “trans, nonbinary” is the best way to describe themselves, compared to one-third of trans adults 35 or older. Given the majority of trans adults are younger than 35, non-binary or gender non-conforming identities may become even more prevalent among trans adults as the population ages.

Consistent with these findings, about half of trans adults (48%) use they/them pronouns, and about one-third say they use a combination of they/them, she/her or he/him pronouns. Seven in ten trans adults identify as lesbian, gay, queer, or bisexual. This survey finds trans adults and cisgender adults report similar household incomes, even when controlling for age, with four in ten trans adults reporting annual incomes of less than $40,000 (compared to 37% of cisgender adults). However, trans adults are much less likely than cisgender adults to have a college degree, even when accounting for the younger age of this population. About 15% of trans adults report having at least a college degree compared to 35% of cisgender adults. This includes 12% of trans adults under the age of 35 and one in five (19%) of trans adults over age 35 (compared to 31% of cis adults under 35 and 37% over age 35). Few trans adults say they are Republicans (10%) or Republican-leaning independents (4%), with most trans adults identifying as Democrats (42%) or Democratic-leaning independents (26%). Regarding political ideology, six in ten (58%) identify as political liberals, while three in ten (28%) say they are political moderates, and one in seven are conservatives (13%).

THERE ISN’T ONE WAY TO TRANSITION

What it means to “transition” differs widely among trans adults, and not all trans adults may feel the need to transition in any one way or seek the same types of gender affirming care. While the majority (88%) of
trans adults say they have taken at least one of several select actions (described below) in the process of transitioning, these actions vary. Most trans adults report they have made changes to their physical appearance, such as changing the types of clothes they wear (77%) or changing their hairstyle or grooming habits (76%) to better fit their gender identity. Many also report going by pronouns associated with their gender that are different from their sex assigned at birth (72%), with slightly fewer, but still a majority, saying they use a different name than the one on their birth certificate (57%) – even if they have not legally changed their name. About four in ten transgender people report having attended counseling or therapy as a part of their gender transition (38%) (which is sometimes a requirement for other gender affirming care), and one-quarter (24%) having legally changed their name on identifying documents, such as a passport or driver’s license. Smaller shares report having used hormone treatments, HRT or puberty blocking hormones (31%) or having undergone gender-affirming surgery to change their physical appearance (16%).

While most trans adults who identify as nonbinary or gender non-conforming have changed their physical appearance in ways that reflect their gender identity, such as changing the types of clothes they wear (77%) or changing their hair style or grooming habits (76%) and most are going by different pronouns (73%), few from this group have used hormone treatments (17%), legally changed their names (15%), or undergone gender-affirming surgery or other surgical treatments to change their physical appearance (9%). In comparison, among those who identify as trans women or trans men, six in ten have used
hormone treatments, just over four in ten (43%) have legally changed their name and three in ten (31%) have undergone gender-affirming surgery or other surgical treatments.

Figure 11

Trans Women And Men Are More Than Three Times As Likely As Trans Nonbinary And Gender Non-Conforming Adults To Say They Have Used Hormone Treatments, Undergone Gender-Affirming Surgery

At least one in four (27%) trans adults say they have moved to a different part of town, a new city or a new state because they thought it would be a more accepting place for someone who is trans to live, including 35% of trans adults who now live in urban areas. Moving to a different town, city or state to find a more accepting environment is more common for trans adults who say they had an unhappy childhood or unsupportive immediate family. One-third of trans adults who say they had unhappy childhoods (36%) report moving to a more accepting place later in life, compared to one in five (21%) who had happy childhoods. Similarly, nearly half (48%) of trans adults who report having unsupportive families say they moved to a more accepting place, compared to three in ten trans adults with supportive families and one in ten trans adults who are not out to their families. Similar shares of trans adults across race, ethnicity, age, and income report moving to a more accepting place.
In Their Own Words: Is there anything else that you would like to tell us about your experiences of acceptance or discrimination as a trans adult so we can better understand your experiences?

“My gender affirmation process was gradual. It was helpful to have more language for what I call gender expansiveness than 20 years ago when I first came out. This language helped me identify my gender more clearly and further medical options to affirm my identity as a masculine nonbinary person.” – Trans masculine nonbinary, D.C., Black, age 36

“I have never told anyone how I feel about my gender identity.” – Trans, nonbinary, Ohio, White, age 55-64

“I have been fortunate to have found support groups in my area that are accepting of all gender-nonconforming individuals. This was instrumental in developing a clearer understanding of my identity as a trans person, and in providing a means to socialize with other individuals across the transgendered spectrum.” – Trans, gender non-conforming, Florida, White, age 65

“Misgendering day to day. Having gender affirmation surgeries being denied by insurance. Not getting jobs because the manager wasn't LGBTQ friendly.” – Trans woman, Missouri, White, age 25-34
“My experience is unique because I am trans and Black. Trans is hard without family support but you can create your own family through friends. Trans women does not mean you will be alone. People are interested in relationships. Sometimes we are seen as objects to use.” – Trans woman, Virginia, Black, age 39

“There are social and financial reasons why I haven’t come out as trans to my family and people around me. While I know my family would accept me, the process of them really understanding my situation and changing their behavior feels too exhausting in the short term to be worth it, while I’m already dealing with other mental health issues. I’d be interesting in pursuing top surgery and perhaps HRT, but I’m not in a financial situation where I could do that. Also, I work as a coach in youth sports, in cross country and track and field, and I’m afraid of my community’s reaction towards me…” – Trans, nonbinary, Connecticut, age 28

“When using some services, like an emergency room, I’ve had medical professionals get angry when hearing my husband use my correct pronouns. In those cases, I don’t want to end up in a situation where I might be mistreated, so I have my husband just stop gendering me correctly and kind of passively let the person pretend I'm a woman (I'm a trans man). I don't like it, but it feels like the safest way forward.” – Trans man, Ohio, White, age 30

“Everyone who is gender nonconforming deserves the treatment I received from my therapist and doctors. They were extremely helpful, understanding, and patient. They encouraged me to experiment, think, then act. It was a profoundly simple but healthy way to approach the subject of transition…” – Trans woman, California, White, age 25

Trans Adults in U.S. Report High Levels of Discrimination

Despite taking steps to lessen experiences of stigma and discrimination, such as moving to places believed to be more accepting, more than six in ten trans adults (63%) say they feel discriminated against because of their gender identity and expression at least sometimes. Trans people of color report experiencing discrimination on multiple intersectional fronts, with most feeling discriminated against because of their gender identity (63%), their race or ethnicity (59%), their income level or education (58%) and their sexual orientation (53%).
Verbal attacks are the most commonly experienced discrimination measured in the poll. A majority of trans adults (64%) say they have been verbally attacked because of their gender identity, gender expression or sexual identity. One in four trans adults say they have been physically attacked because of their gender identity, gender expression, or sexual identity. The share of trans adults who have been physically attacked because of their gender identity increases to 31% among trans people of color.

Trans adults face other types of discrimination beyond verbal and physical attacks, including being asked unnecessary or invasive questions at their place of work (49%) or being harassed or feeling unsafe in a restroom or locker room (41%) because of their gender or sexual identity. One in five trans adults say they have been fired, denied a job or promotion (21%) or been refused health care from a health care provider (17%) due to their gender identity. One in eight trans adults (13%) say they have been evicted or denied housing because of their gender identity or expression, increasing to one in five (21%) among trans people of color.
Experiences with discrimination are far more common among trans adults who physically present as a gender different from their sex assigned at birth at least most of the time. Three-quarters of those who present as a different gender all or most of the time say they have been verbally attacked for their gender identity or sexual orientation, compared with half of those who present as a different gender some of the time or less. In addition, three in ten trans adults who physically present as a different gender report being physically attacked.

Beyond verbal and physical attacks, trans adults who physically present as a different gender at least some of the time are more likely to report being asked unnecessary or invasive questions at work (61%), being harassed or feeling unsafe in a restroom or locker room (50%), being fired or denied a job or promotion (29%), or being refused health care (24%).
Trans adults living in urban areas are also more likely than their suburban and rural counterparts to report facing certain types of discrimination, including one-third of trans urban residents who say they have been physically attacked, despite being no more likely than those living in suburban and rural areas to say they physically present as a gender different from their sex assigned at birth at least some of the time.
Difficulty Accessing Health Care

Trans adults report significant issues accessing gender-affirming health care, that is health care that supports and affirms an individual’s gender identity when it differs from the gender they were assigned at birth. This includes counseling, routine health visits, medications, and surgeries, among other services. About three in ten trans adults say they have had to teach a doctor or other health care provider about trans people so they could get appropriate care (31%), had a doctor or other health care provider refuse to acknowledge their preferred gender identity and instead refer to their sex assigned at birth (31%), or been asked unnecessary or invasive questions about their gender identity unrelated to their visit (29%). About one in five (17%) trans adult say they have had a doctor or other health care provider refuse to provide them with gender-affirming treatment, such as hormone treatments (17%).

![Figure 17](image)

Nearly half (47%) of trans adults say the health care providers they have come into contact with know “not too much” or “nothing at all” about providing health care to trans people. Just 10% say their health care providers know “a lot,” which is the same as the share who say their providers know “nothing at all.” Larger shares of young trans adults (54% of those ages 18-34) say doctors and health care providers know “not too much” or “nothing at all” about providing health care for trans people compared to 38% of trans adults ages 35 and older who say the same.
Among trans adults with health insurance, about a quarter (27%) say their insurance covers gender-affirming treatment or health care, while 14% say their health insurance does not cover this and six in ten (58%) are unsure. More generally, one in five trans adults say they have had health insurance that would not cover gender-affirming treatments or health care (22%). About one in seven trans adults have changed jobs or health insurance in order to get gender-affirming treatments or health care.

Most trans adults (72%) say they currently have a doctor or health care provider they feel comfortable seeking health care from, however, trans adults report more difficulty accessing routine health care than
cisgender adults. Nearly half of trans adults (46%) say it is difficult to find health care that they can afford, compared to 37% of cisgender adults. Nearly half of trans adults (47%) also report it’s difficult to find a health care provider they can get an appointment with quickly (compared to 37% of cisgender adults). Trans adults also more likely to say they have difficulty finding a health care provider who treats them with dignity and respect (37% trans adults vs. 24% cisgender adults), or health care at a location that is easy for them to get to (35% trans adults vs. 21% cisgender adults).

Difficulty accessing routine health care transcends age and racial identities among trans people. Significant shares of trans adults ages 18-34 and ages 35 and older say it’s difficult to get health care they can afford (46% for both groups), a quick appointment (51% v. 42%), a provider who treats them with a dignity and respect (42% v. 29%), or health care at an easy location to get to (39% v. 31%). In addition, at least one third white trans adults and trans people of color report difficulties finding health care they can afford (49% v. 41%), a quick appointment (48% v. 45%), a provider who treats them with a dignity and respect (39% v. 33%), or health care at an easy location to get to (39% v. 31%).

**Mental Health**

With most Americans saying the U.S. is facing a mental health crisis, and LGBTQ people having historically faced widespread mental health disparities, the KFF-Post poll also asked about mental health experiences and access to mental health services. More than four in ten trans adults report feeling anxious (56%), depressed (48%), or lonely (44%), either always or often in the past 12 months. The share of trans adults who report these feelings in the past year is larger than the share of cisgender adults (31% report feeling anxious, 21% depressed, and 21% lonely). Trans adults are also less likely than their cisgender counterparts to report feeling happy (40% compared to 59%) or hopeful (29% compared to 50%) always or often over the past 12 months.
Similar to overall life satisfaction, about half of trans adults with families that are unsupportive of their trans identities report feelings of depression, loneliness, and anxiety. Feelings of hopefulness are higher among trans adults who say they have supportive immediate families. Younger trans adults are more likely to report feelings of anxiety and depression, though these age gaps mirror those among the general public.

The KFF-Post poll finds large shares of LGBT adults, and specifically transgender adults, report struggling with serious mental health issues. This includes one-third (34%) of all LGBT adults as well as more than four in ten (43%) trans adults who say they have had suicidal thoughts in the past 12 months. Trans adults are about six times as likely as cisgender adults to say they have engaged in self-harm in the past year, and more than twice as likely to say they have had an eating disorder in the past year or had suicidal thoughts in the past year.
Similar to previous studies finding that younger adults are more likely to report serious mental health struggles, younger trans adults ages 18 to 34 are more likely than older trans adults ages 35 and older to report having had suicidal thoughts in the past year (50% v. 36%) or having self-harmed in the past year (25% v. 9%).

The shares of trans adults who report having suicidal thoughts increases to half of those with unsupportive family members. In addition, about one in four of these individuals say they have engaged in self-harm in the past 12 months.

**ACCESSING MENTAL HEALTH CARE**

Nearly half of trans adults (47%) say there was a time in the past year where they needed mental health services or medications but didn’t get them (compared to a quarter of cisgender adults who say the
Among those who did not get mental health services or medication, three in ten say the main reason was because they could not afford them, 22% say it was because they were too busy, 17% say they were afraid or embarrassed to seek care and one in ten say they couldn’t find an appropriate provider. Relatively few say it was because they didn’t know how to find services (7%), that their insurance wouldn’t cover it (5%), that they had a long wait for an appointment (3%), that they didn’t want medication (2%) or were discriminated against or didn’t feel safe getting treatment (2%).

Trans adults under age 35 are more likely than those ages 35 and older to say they could not access needed mental health services at some point in the past year (55% vs. 39%). Among the younger trans population, cost was the biggest deterrent from getting needed mental health care. One-third of trans adults 18-34 who said they did not get the care they thought they needed, said they didn’t get this care due to the cost (14% of all trans adults). For older trans adults, cost was among a list of reasons for not getting care. One in four trans adults 35 and older said they didn’t mental health care due to cost (9% of total trans adults 35 or older), which is similar to the share who say they were too embarrassed or afraid to seek care (24%, 9%). The difficulty that younger trans adults report getting mental health care is similar to the reasons provided by younger cisgender adults.

Americans’ Views of Transgender People and Issues

In the U.S., views towards trans people and gender identity are sharply divided by partisanship and whether cisgender adults personally know someone who is trans. More than four in ten cisgender adults
(43%) say they personally know someone who is trans, including one in ten who say they have a close friend who is trans and one in ten who say they have a trans family member.

Just over half of adults (57%) say whether someone is a man or woman is determined by the sex they were assigned at birth, with about four in ten adults saying that someone can be a man or woman even if that is different from the sex they were assigned at birth. However, cisgender adults who say they personally know someone who is trans are much more likely than those who do not know anyone who is trans to say that a person’s gender can be different from the sex they were assigned at birth (53% v. 35%). In addition, eight in ten (82%) of Republicans say that whether a person is a man or woman is determined by their sex assigned at birth, compared to far fewer Democrats (35%) and independents (54%) who say the same.

**ACCESS TO GENDER-AFFIRMING CARE FOR YOUNG TRANS PEOPLE**

Gender-affirming care is a model of care which includes a range of behavioral and medical interventions aimed at affirming an individual’s gender identity. Most major U.S. medical associations, including those in the fields of pediatrics, endocrinology, and mental health recognize the medical necessity and
appropriateness of gender affirming care for transgender and gender diverse youth, often describing the harmful effects denying such care can have.

Majorities of transgender adults and cisgender adults support trans children and teenagers having access to gender-affirming counseling. Eight in ten trans adults (79%) and six in ten cisgender adults (62%) support trans children between the ages of 10 and 14 having accessing gender-affirming counseling, similar to the share of trans adults (79%) and cisgender adults (66%) who say the same about trans teenagers, ages 15 through 17. At least two-thirds of trans adults also support trans children between the ages of 10 and 14 to have access to puberty-blocking medications (69%) and three-fourths support trans teenagers (between the ages of 15 and 17) have access to hormonal treatments. However, less than half of cisgender adults support trans children or teenagers having access to either of these gender-affirming treatments.

Overall, views towards trans children and teenagers having access to gender-affirming health care vary sharply by partisanship. While most Democrats or independents support trans children having access to gender-affirming therapy or counseling under medical supervision, fewer than half of Republicans say they support this. However, Republicans are almost five times more likely to support access to gender-affirming therapy than they are to support access to puberty-blocking medication under medical supervision. About half of Democrats (51%) and a third of independents (36%) support trans children ages 10-14 having access to puberty-blocking medication, compared to just one in ten Republicans (9%). A majority of Democrats (64%) and about half of independents (48%) support teenagers ages 15-17 having access to hormonal treatments, compared to 16% of Republicans who say the same.
Partisanship and geography are strongly connected, and this applies to views of trans issues as well. While about half of rural residents and majorities of suburban and urban residents support trans children ages 10 to 14, and trans teenagers having access to gender-affirming counseling or therapy under medical supervision, support for access to medications vary sharply depending on where people live. Urban residents are about twice as likely as rural residents to support trans children ages ten to fourteen having access to puberty-blocking medication (38% v. 19%), with suburban residents falling in between (29%). When it comes to trans teenagers, at least four in ten urban residents (46%) and suburban residents (42%) support access to hormonal treatments compared to 29% of rural residents. Support for trans teenagers having access to hormonal treatments is also slightly lower in states with Medicaid policies that exclude trans care compared to states without these exclusions.
SUPPORT FOR LAWS PROTECTING TRANS ADULTS AGAINST DISCRIMINATION

A majority of the U.S. public supports laws that protect trans adults against discrimination in several areas, from housing to health care. Support for these policies also holds across party lines. While a majority of Republicans support laws prohibiting discrimination against trans people in all cases except in the U.S. military, a larger share of Republicans compared to Democrats oppose laws that prohibit discrimination against trans people. Majorities of both cisgender and trans Americans say they support laws that prohibit discrimination against trans people in all the areas asked about.
TEACHING GENDER IDENTITY IN SCHOOLS

Large shares of adults say they think it is “inappropriate” to discuss trans identity in public schools with students before grade 6 including three-fourths of adults who say it is “inappropriate” to discuss trans identity with students in kindergarteners through third grade and seven in ten who say the same about students in grades 4 and 5. About half of adults say it is “appropriate” to discuss trans identity with students in middle school and most (64%) adults say it is “appropriate” to have these discussions with high school students. Trans adults are much more supportive of discussing trans identity in schools compared to cisgender adults, with support increasing among older grades. A majority of trans adults say they think it is “appropriate” to discuss trans identity with students in grades kindergarten to third grade (64%), elementary school grades four and five (71%), middle school (82%), and high school (87%). Trans adults are more than twice as likely as cisgender adults to say they think it is “appropriate” to discuss trans identity with the youngest students (kindergarten through third grade and grades four and five).
While a majority of Democrats, independents and Republicans say it is inappropriate to discuss gender identity with the youngest students in kindergarten through third grade, most Democrats say it is “appropriate” to have these discussions with students at every other grade level. Republicans, on the other hand, stand out in their near-universal opposition to discussing trans identity with younger students, with well over 9 in 10 saying it is “inappropriate” to discuss with students in kindergarten through third grade and in fourth and fifth grade. Two-thirds of Republicans say it is “inappropriate” for teachers to discuss trans identity with high school students.

TRANS ATHLETES’ PARTICIPATION IN SPORTS

With the recent attention on the participation of trans athletes in sports, the survey finds a majority of adults in the U.S. are opposed to trans women and girls competing in sports at every level with other women and girls; however, notable divisions exist among partisans, trans and cisgender adults and
among cisgender adults who personally know someone who is trans. Majorities of trans adults as well as Democrats say trans women and girls should be allowed to compete with cisgender women and girls in sports at each level. About four in ten cisgender adults who personally know someone who is trans say trans women and girls should be allowed to compete with other women and girls at all levels.

While most adults say that trans women and girls should not be allowed to compete in various levels of sports, just over half (54%) of cisgender adults and about three-fourths (73%) of trans adults say they are either "very concerned" or "somewhat concerned" the mental health of trans girls will suffer if they are not allowed to compete with other girls in youth sports.
Methodology

The KFF/Washington Post is a partnership combining survey research and reporting to better inform the public. The KFF/Washington Post Trans Survey is the 36th in the series and focuses on the experiences of trans adults living in the U.S.

The survey was designed to reach a representative sample of adults in the U.S. who identify as transgender or as a trans adult along with a comparison representative of the general population of U.S. adults. The survey was conducted November 10 – December 1, 2022, online and by telephone among a nationally representative sample of 515 U.S. adults who identify as trans and another 823 cisgender U.S. adults who do not identify as trans and their gender is the same as their sex assigned at birth. All survey respondents received a financial incentive for participating in the survey. Sampling, data collection, weighting, and tabulation were managed by SSRS of Glenn Mills, Pennsylvania. Teams from KFF and The Washington Post worked together to develop the questionnaire and analyze the data, and both organizations contributed financing for the survey.

Sampling and Recruitment

Interviews were conducted in English and Spanish among a nationally representative sample of 515 trans adults. The sample of trans adults was recruited using three probability-based online panels, the Gallup Panel (n=252), NORC’s AmeriSpeak panel (n=146), and the SSRS Opinion Panel (n=85). All three of these nationally representative panels are recruited using probability-based methodologies (SSRS and Gallup recruit using both RDD and ABS, while NORC relies on ABS). In order to interview under-surveyed populations, the project also includes telephone interviews from calling back respondents from previous KFF surveys (n=29) or from previous SSRS Omnibus surveys (n=3) who identified as lesbian, gay, bisexual, or trans.

The comparison sample of the U.S. adult population (n=823) was conducted in English and Spanish using the SSRS Opinion Panel either online (n=784) or panel members who do not use the internet were reached by phone (n=39).

Weighting and Data Processing

Trans adults from the combined phone and panel samples were weighted separately to match the sample’s demographics to the national U.S. adult trans population using data from the CDC’s Behavioral Risk Factor Surveillance System (BRFSS) as well as the Williams Institute’s analysis of BRFSS, which used small area estimation to model demographics for states that had not recently asked the sexual orientation and gender identity module. The weighting parameters included age, education, race/ethnicity, and region. The weights take into account differences in the probability of selection for each sample type (callback phone sample and panel). This includes adjustment for the sample design, within household probability of selection, and the design of the panel-recruitment procedure.

The full sample of U.S. adults was weighted to match the sample’s demographics to the national U.S. adult population using data from the Census Bureau’s 2021 Current Population Survey (CPS). Weighting
parameters included sex, age, education, race/ethnicity, region, and education. The sample was also weighted to match patterns of civic engagement from the September 2019 Volunteering and Civic Life Supplement data from the CPS. The sample was also weighted to match frequency of internet use from the National Public Opinion Reference Survey (NPORS) for Pew Research Center. The weights take into account differences in the probability of selection for each sample type (callback phone sample and panel). This includes adjustment for the sample design, within household probability of selection, and the design of the panel-recruitment procedure.

The margin of sampling error including the design effect for the trans adult sample is plus or minus 7 percentage points and plus or minus 4 percentage points for the non-trans adult sample. For results based on other subgroups, the margin of sampling error may be higher. Sample sizes and margins of sampling error for other subgroups are available by request. Sampling error is only one of many potential sources of error and there may be other unmeasured error in this or any other public opinion poll. KFF and The Washington Post are a charter members of the Transparency Initiative of the American Association for Public Opinion Research.

Each organization bears the sole responsibility for the work that appears under its name. The project team from the Kaiser Family Foundation included: Mollyann Brodie, Ph.D., Ashley Kirzinger, Ph.D., Audrey Kearney, Alex Montero, and Grace Sparks. The project team from The Washington Post included: Scott Clement and Emily Guskin. Special thanks to Eran Ben-Porath, Ph.D. and Jazmyne Sutton, Ph.D. from SSRS, as well as Jenny Marlar, Ph.D. (Gallup), Jenny Benz, Ph.D. (NORC) for their contributions to the sampling design.
Filling the need for trusted information on national health issues,
KFF (Kaiser Family Foundation) is a nonprofit organization based in San Francisco, California.
